The Molonglo Telescope

- **Mills-Cross design (Only E-W currently functional)**
- **Collecting area: 18000 m²**
- **Field of view: 4.25x2.8 deg²**
- **45 arcsec x 1.4 degrees localisation**
- **Centre Frequency: 843 MHz**
- **Bandwidth: 31.25 MHz/320 channels**
- **Commensal science (FRB + Pulsars)**

Random Forest based Candidate Classification

Within
10 seconds

Low False

Candidate rate (~5/day)

Transient Candidate

SNR 9.03
DM 61.57
Width 5.24 ms
Probability 0.821
Name CAND 2018-01-30-22:18:44.7
UTC 2018-01-30-22:18:44.7

Observation

UTC START 2018-01-30-22:16:51
Beam 216
MD Offset -0.6420444444444444 degrees
RA Offset -0.697881725475779 degrees
Total Beams 352
PID P003
Voltage Dump false

Boresight Properties

SOURCE FRBTransit_1
LST 16:56:49.1075
DELAY TRACKING false
BORESIGHT RA 16:56:49.1

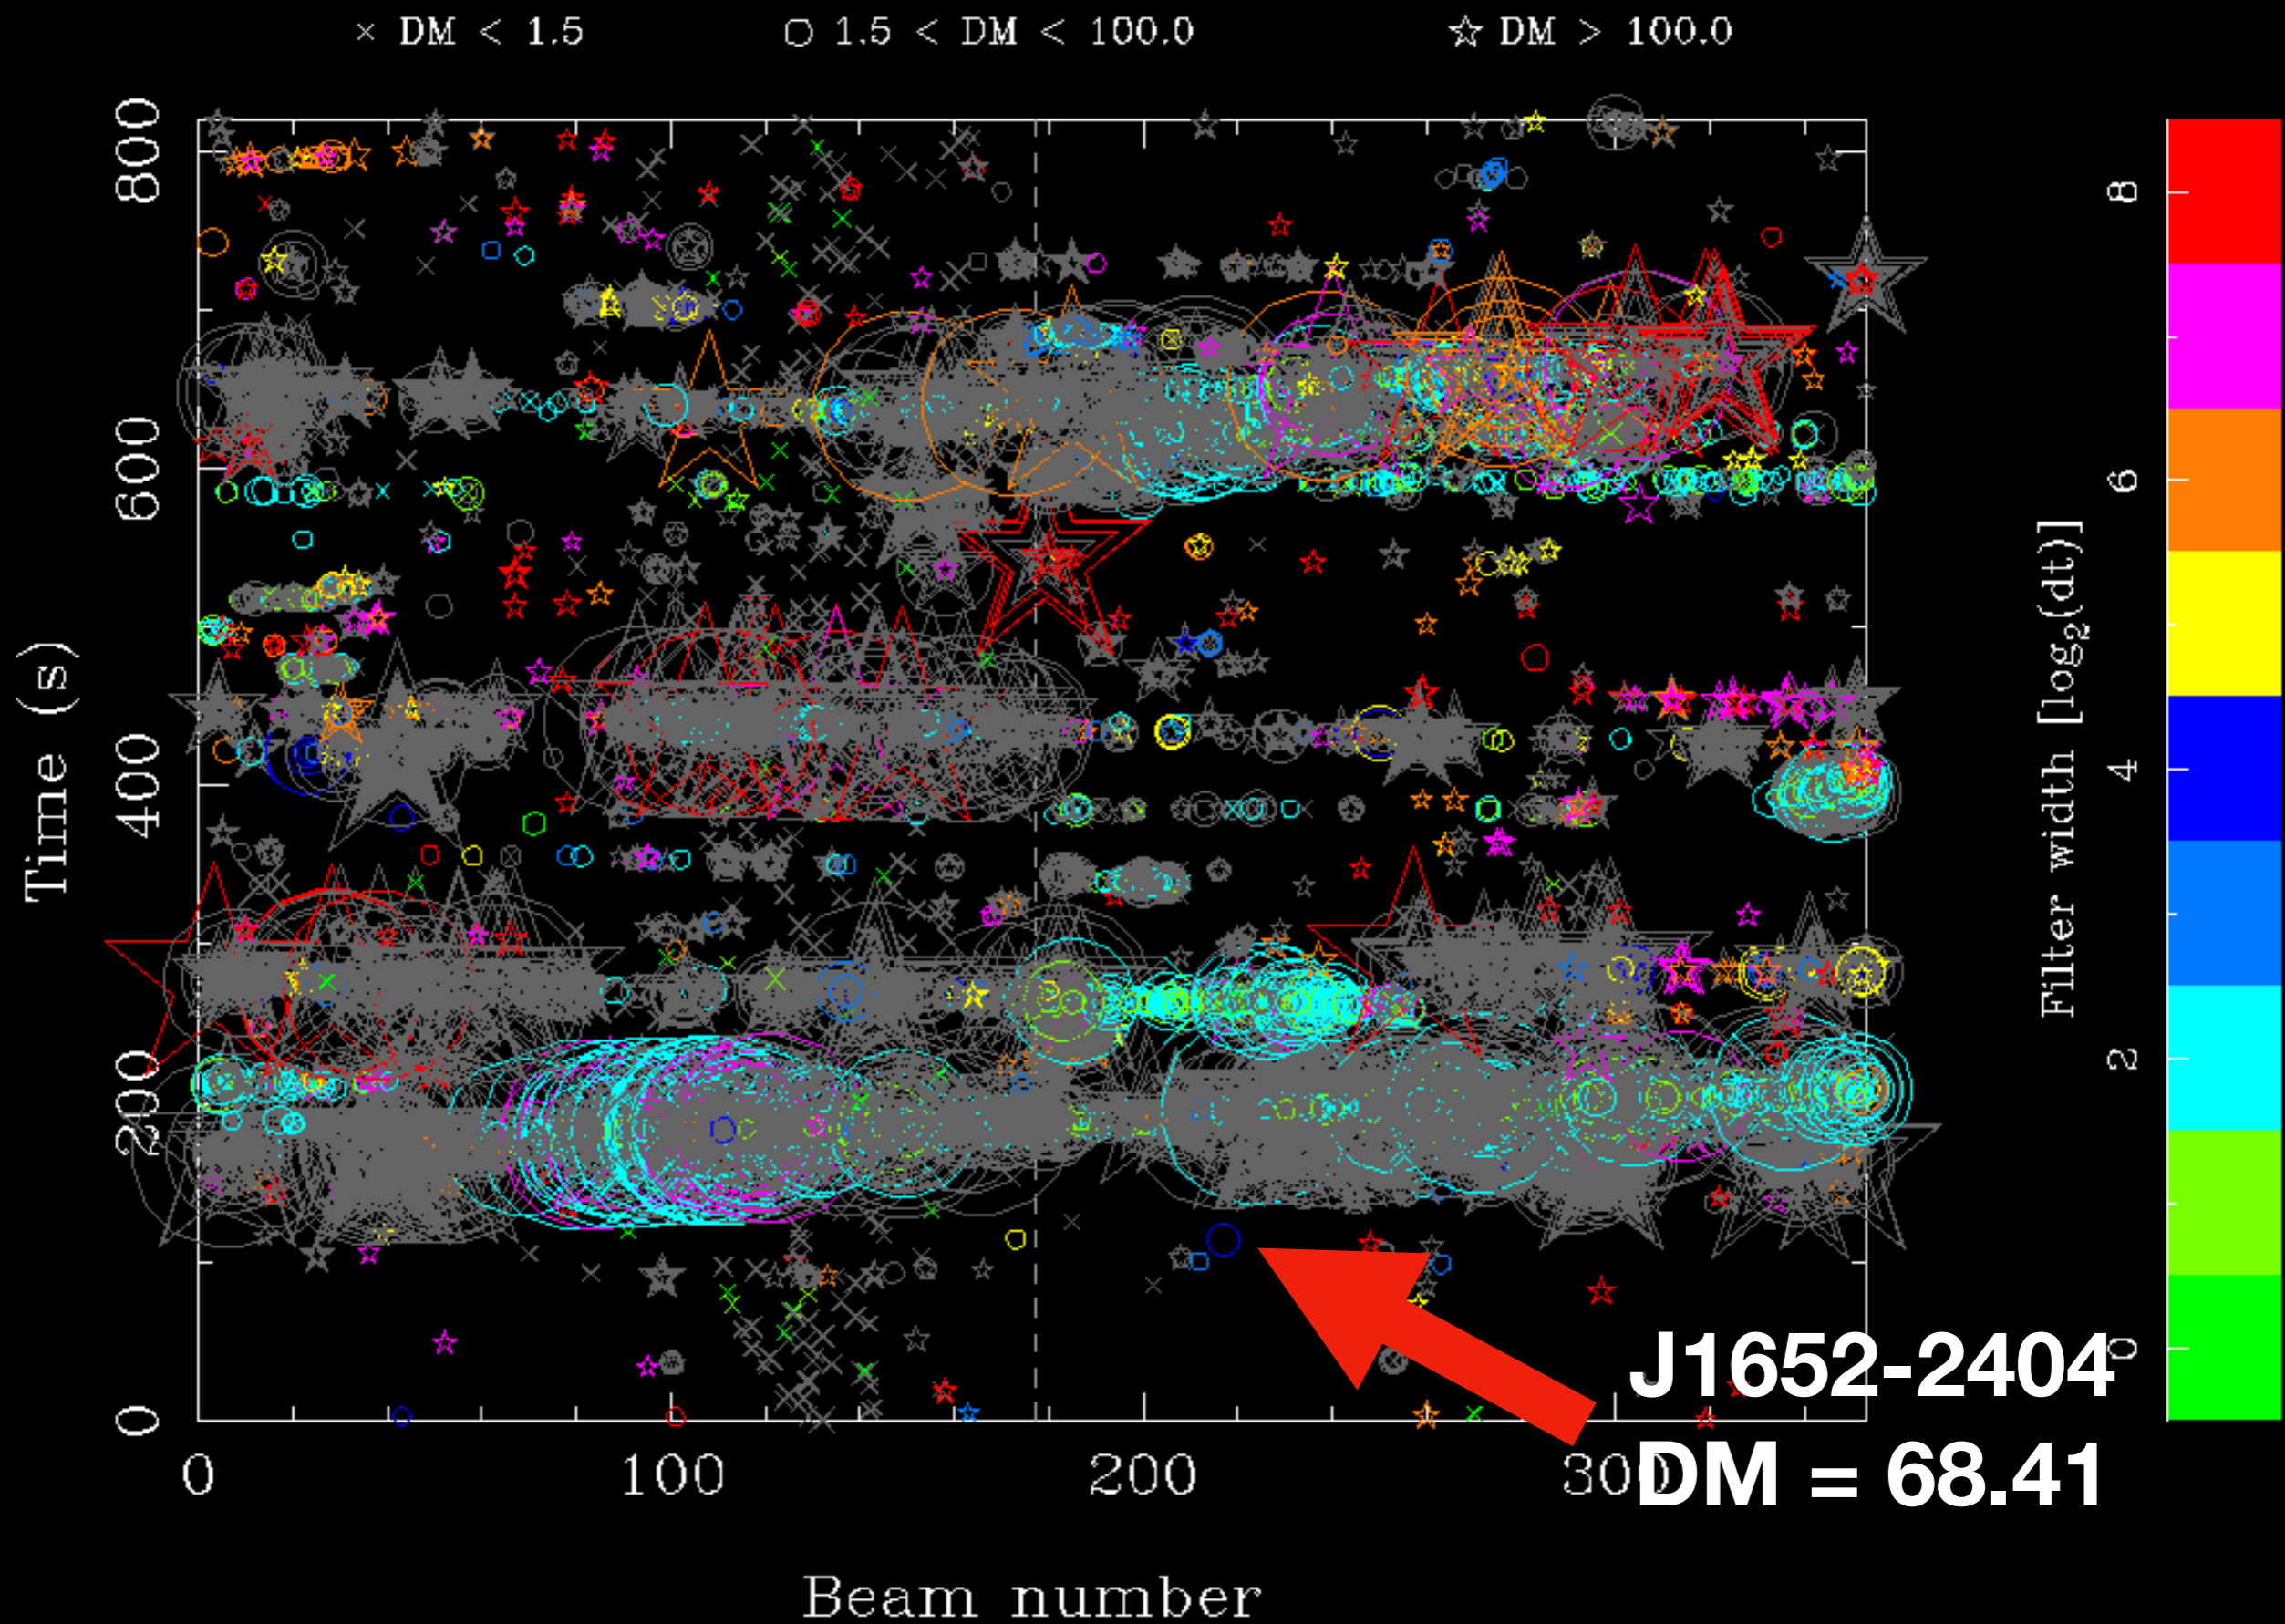

Candidate Position Properties

RA 16:54:01.6
DEC -23:04:31.19
GI 358.270214206
Gb 12.8638583923
NE2001 DM 180.6329

6 Attachments

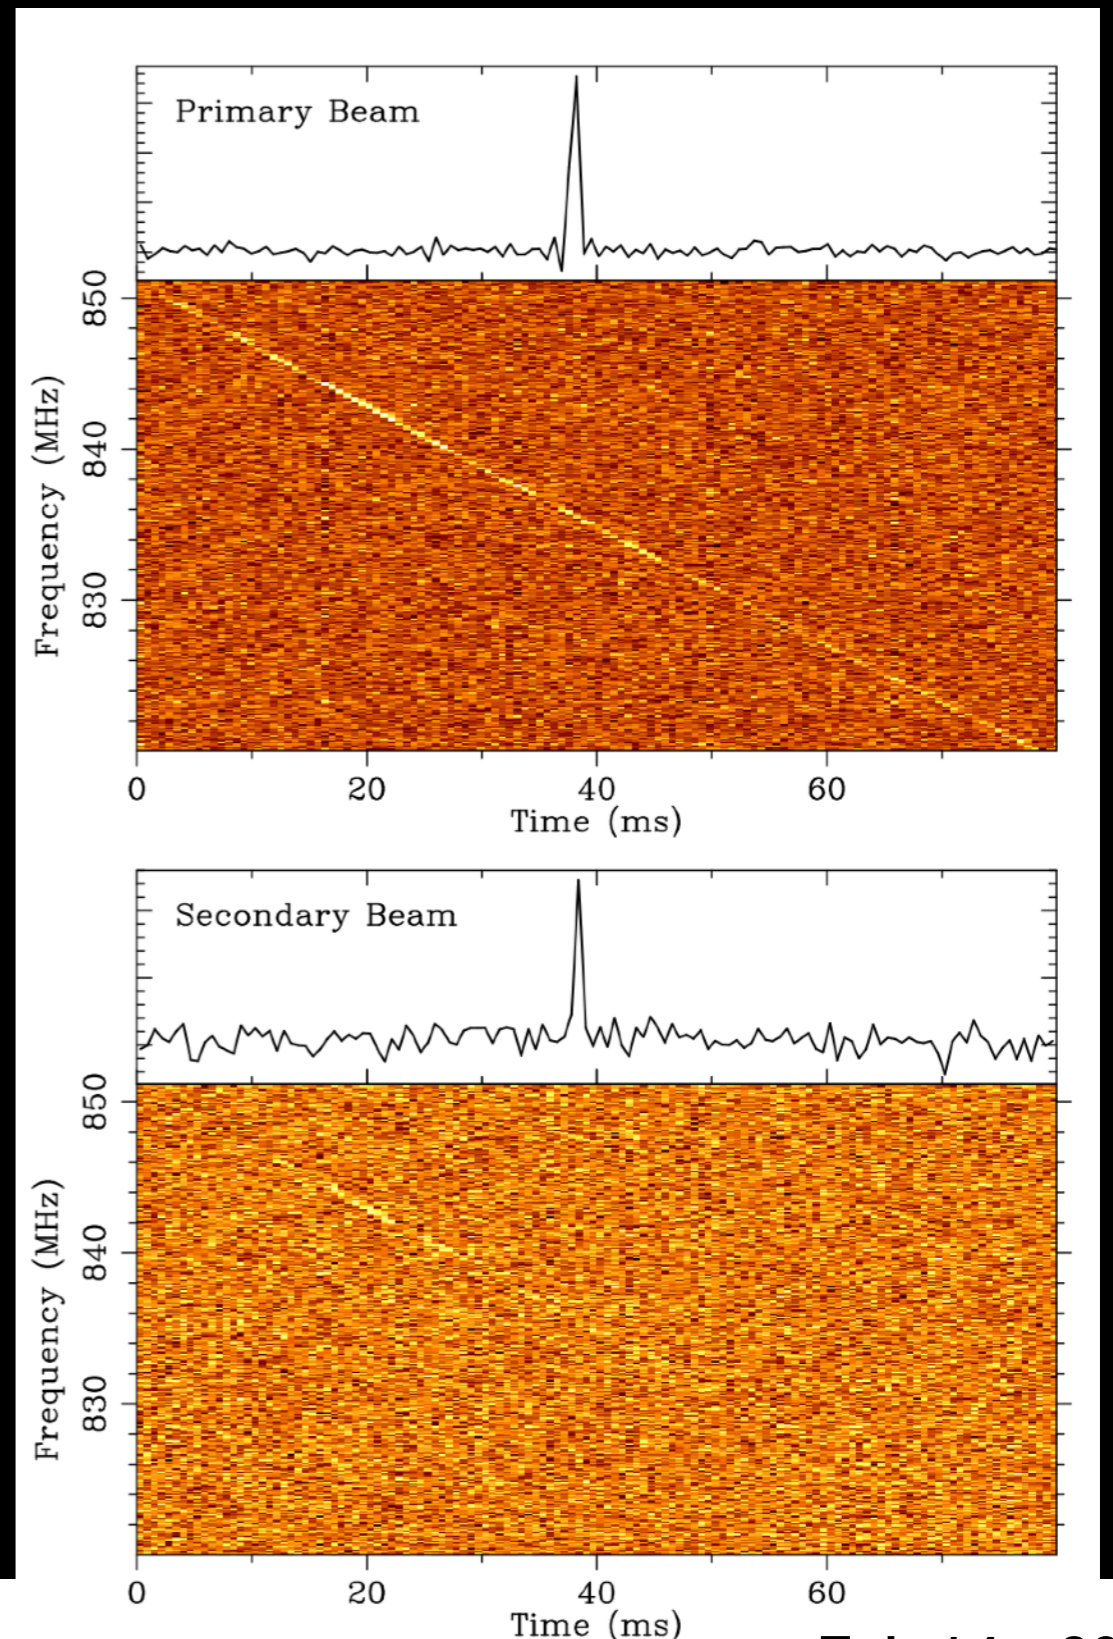

The attachments consist of six plots. Four are spectrograms showing frequency (MHz) vs. time (ms) for beams B0M-201, B0M-177, B0M-213, and B0M-216. Each spectrogram shows a transient signal as a bright orange/yellow streak. The other two are time-series plots showing the signal amplitude over time for beams B0M-177 and B0M-216, with a prominent peak corresponding to the transient.

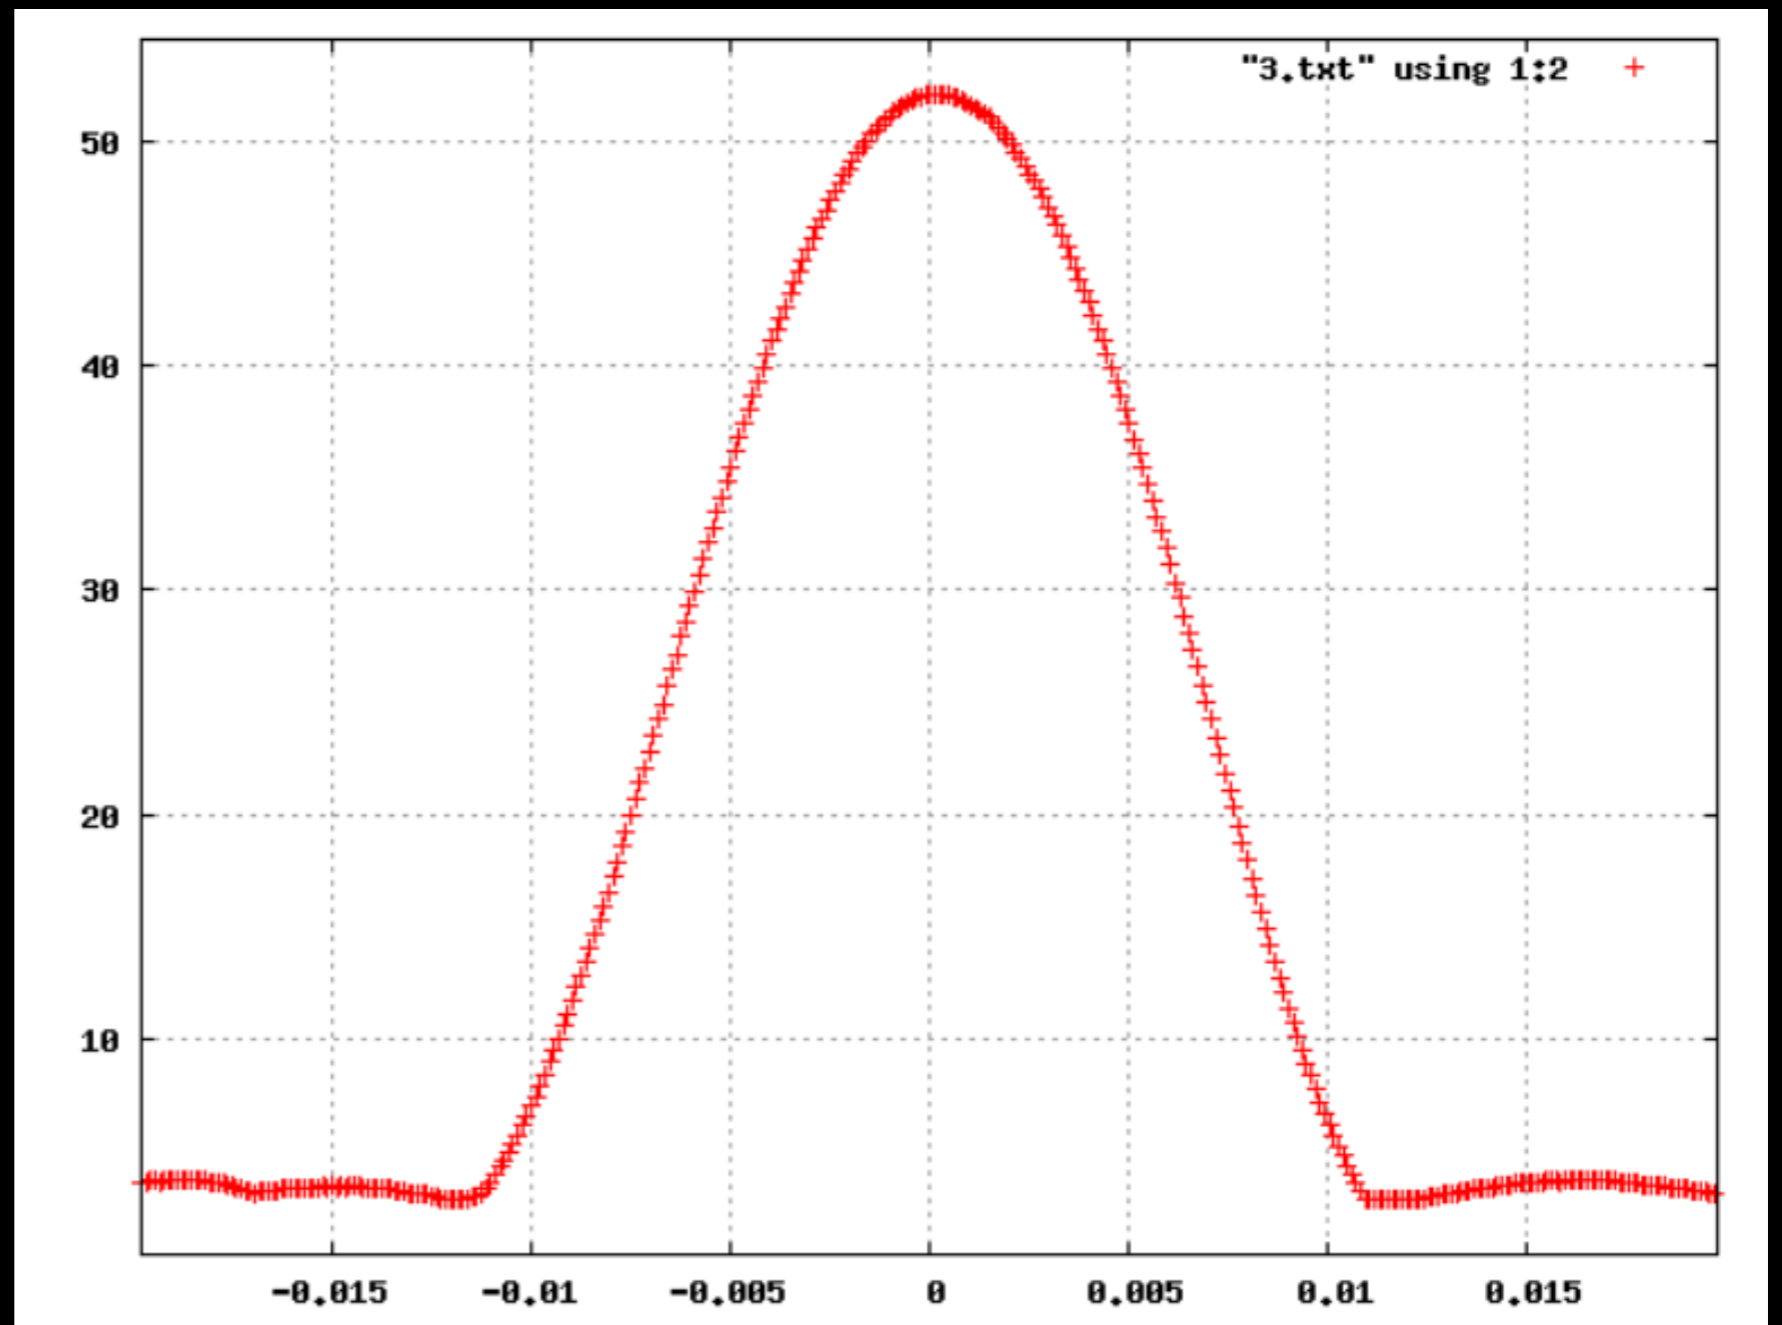

Discovery of FRB 170827

- SNR = 48 (Detection)
- DM = 176.8 (DM_Gal ~ 40)
- $z \sim 0.12$
- Width = 0.4 ms
- $S_{\text{peak}} = 60 \text{ Jy}$
- Fluence = 20 Jyms

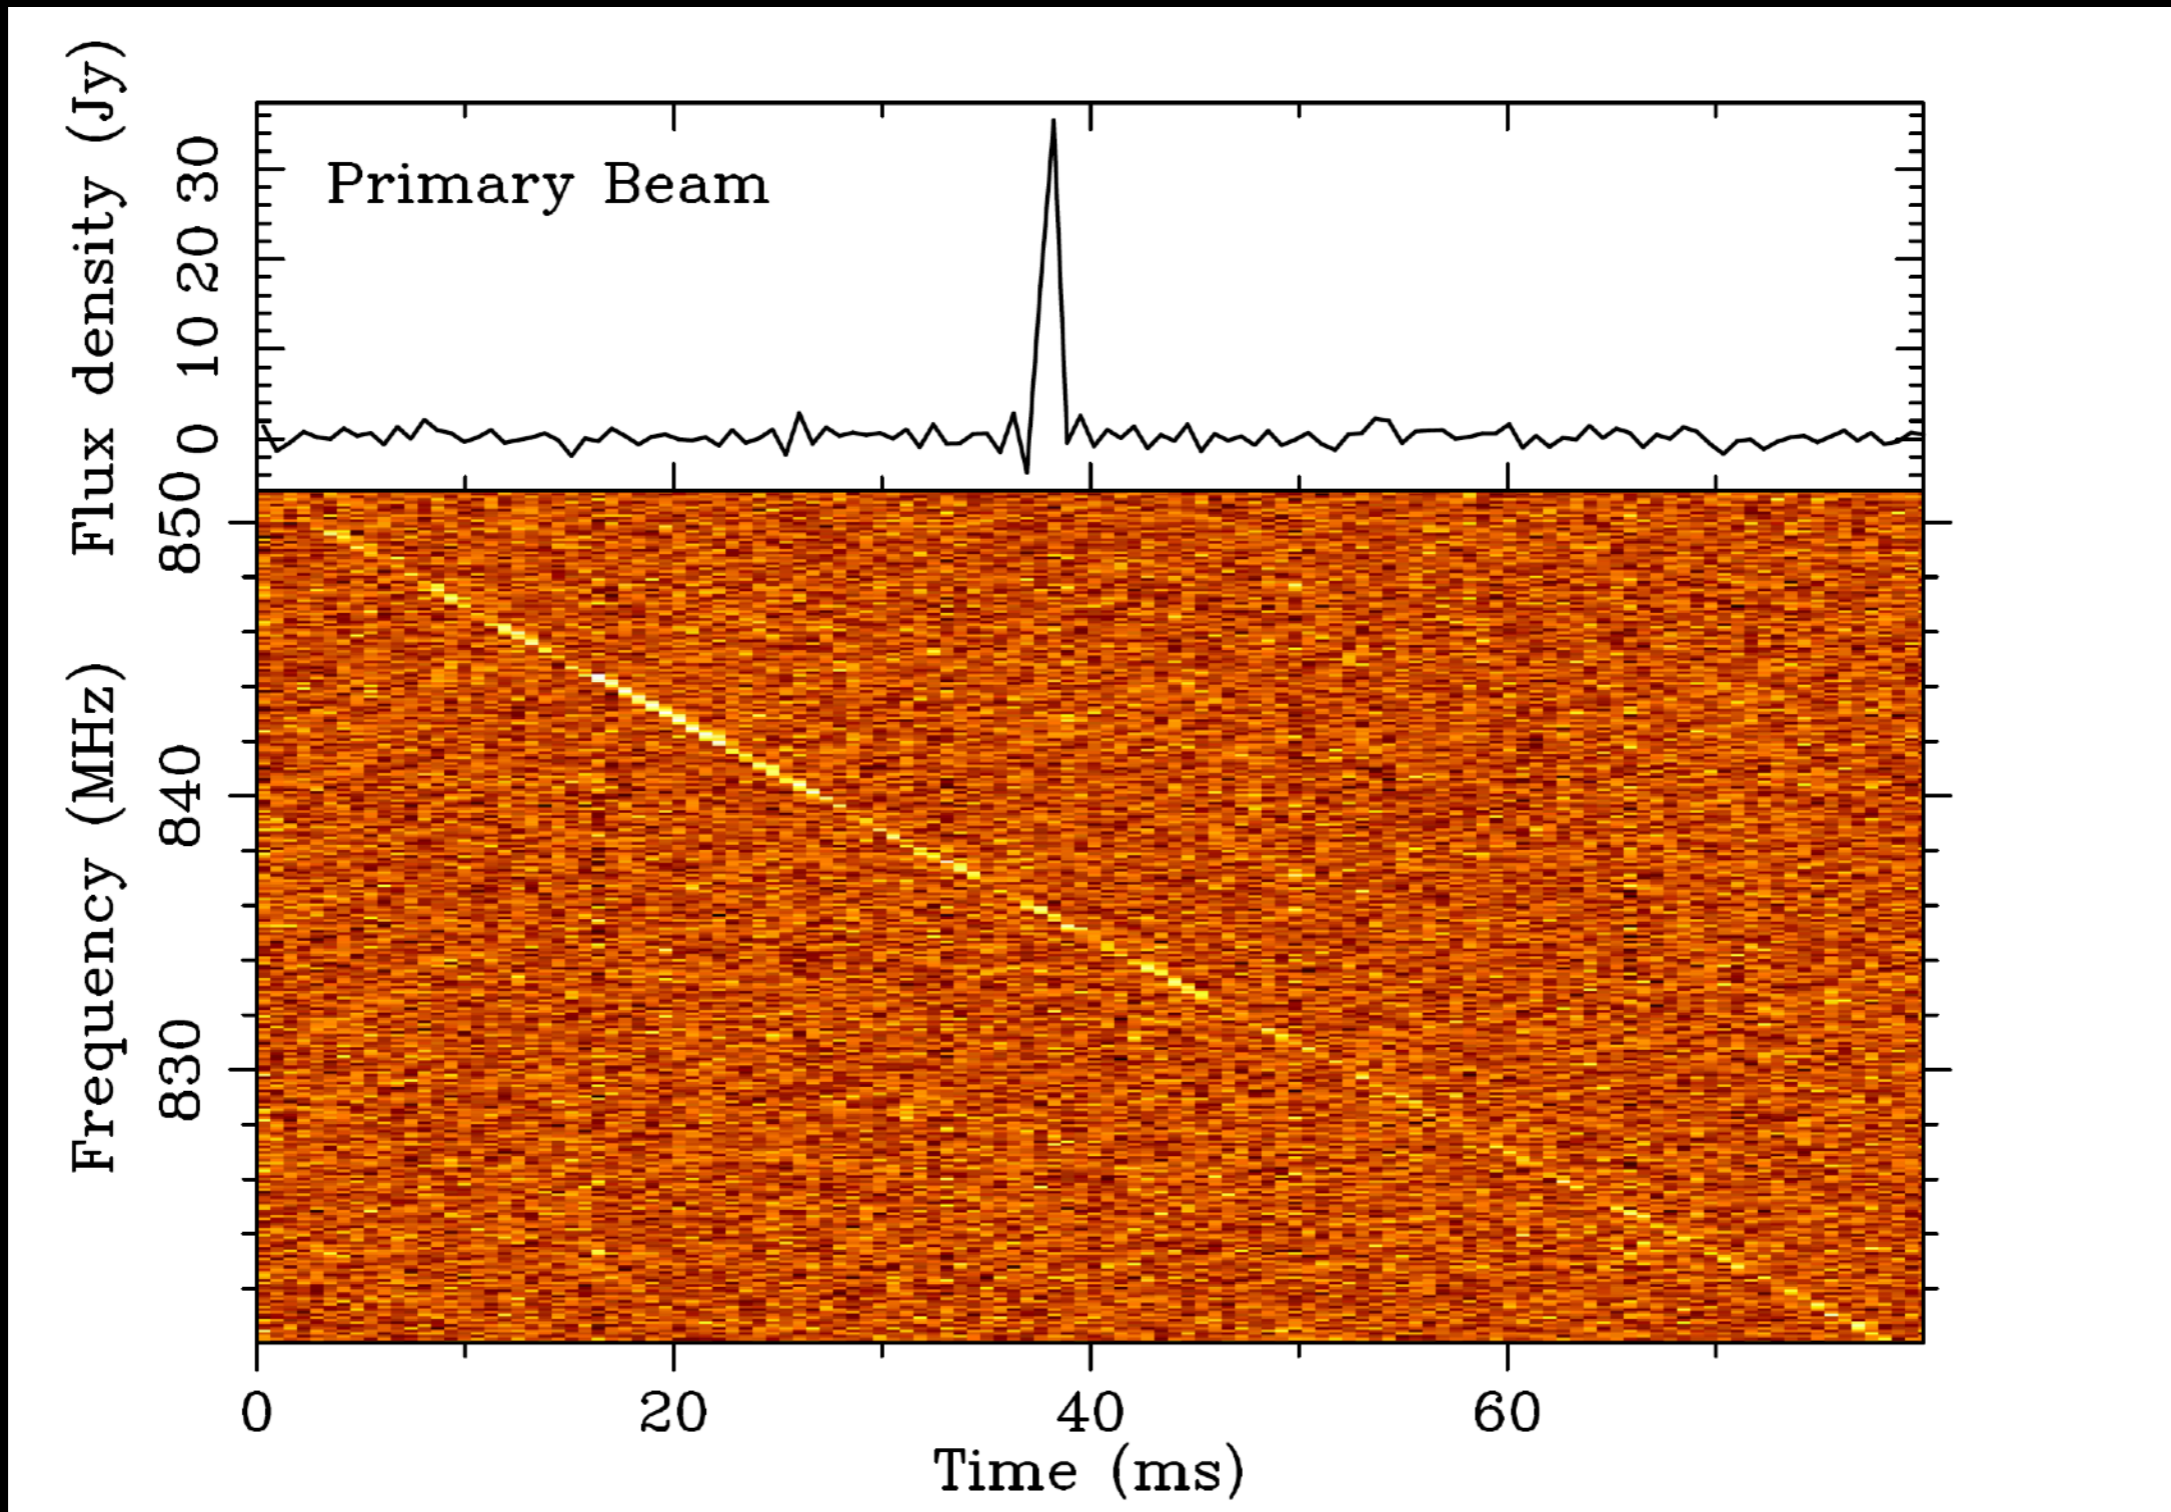

Real Time => Voltage data

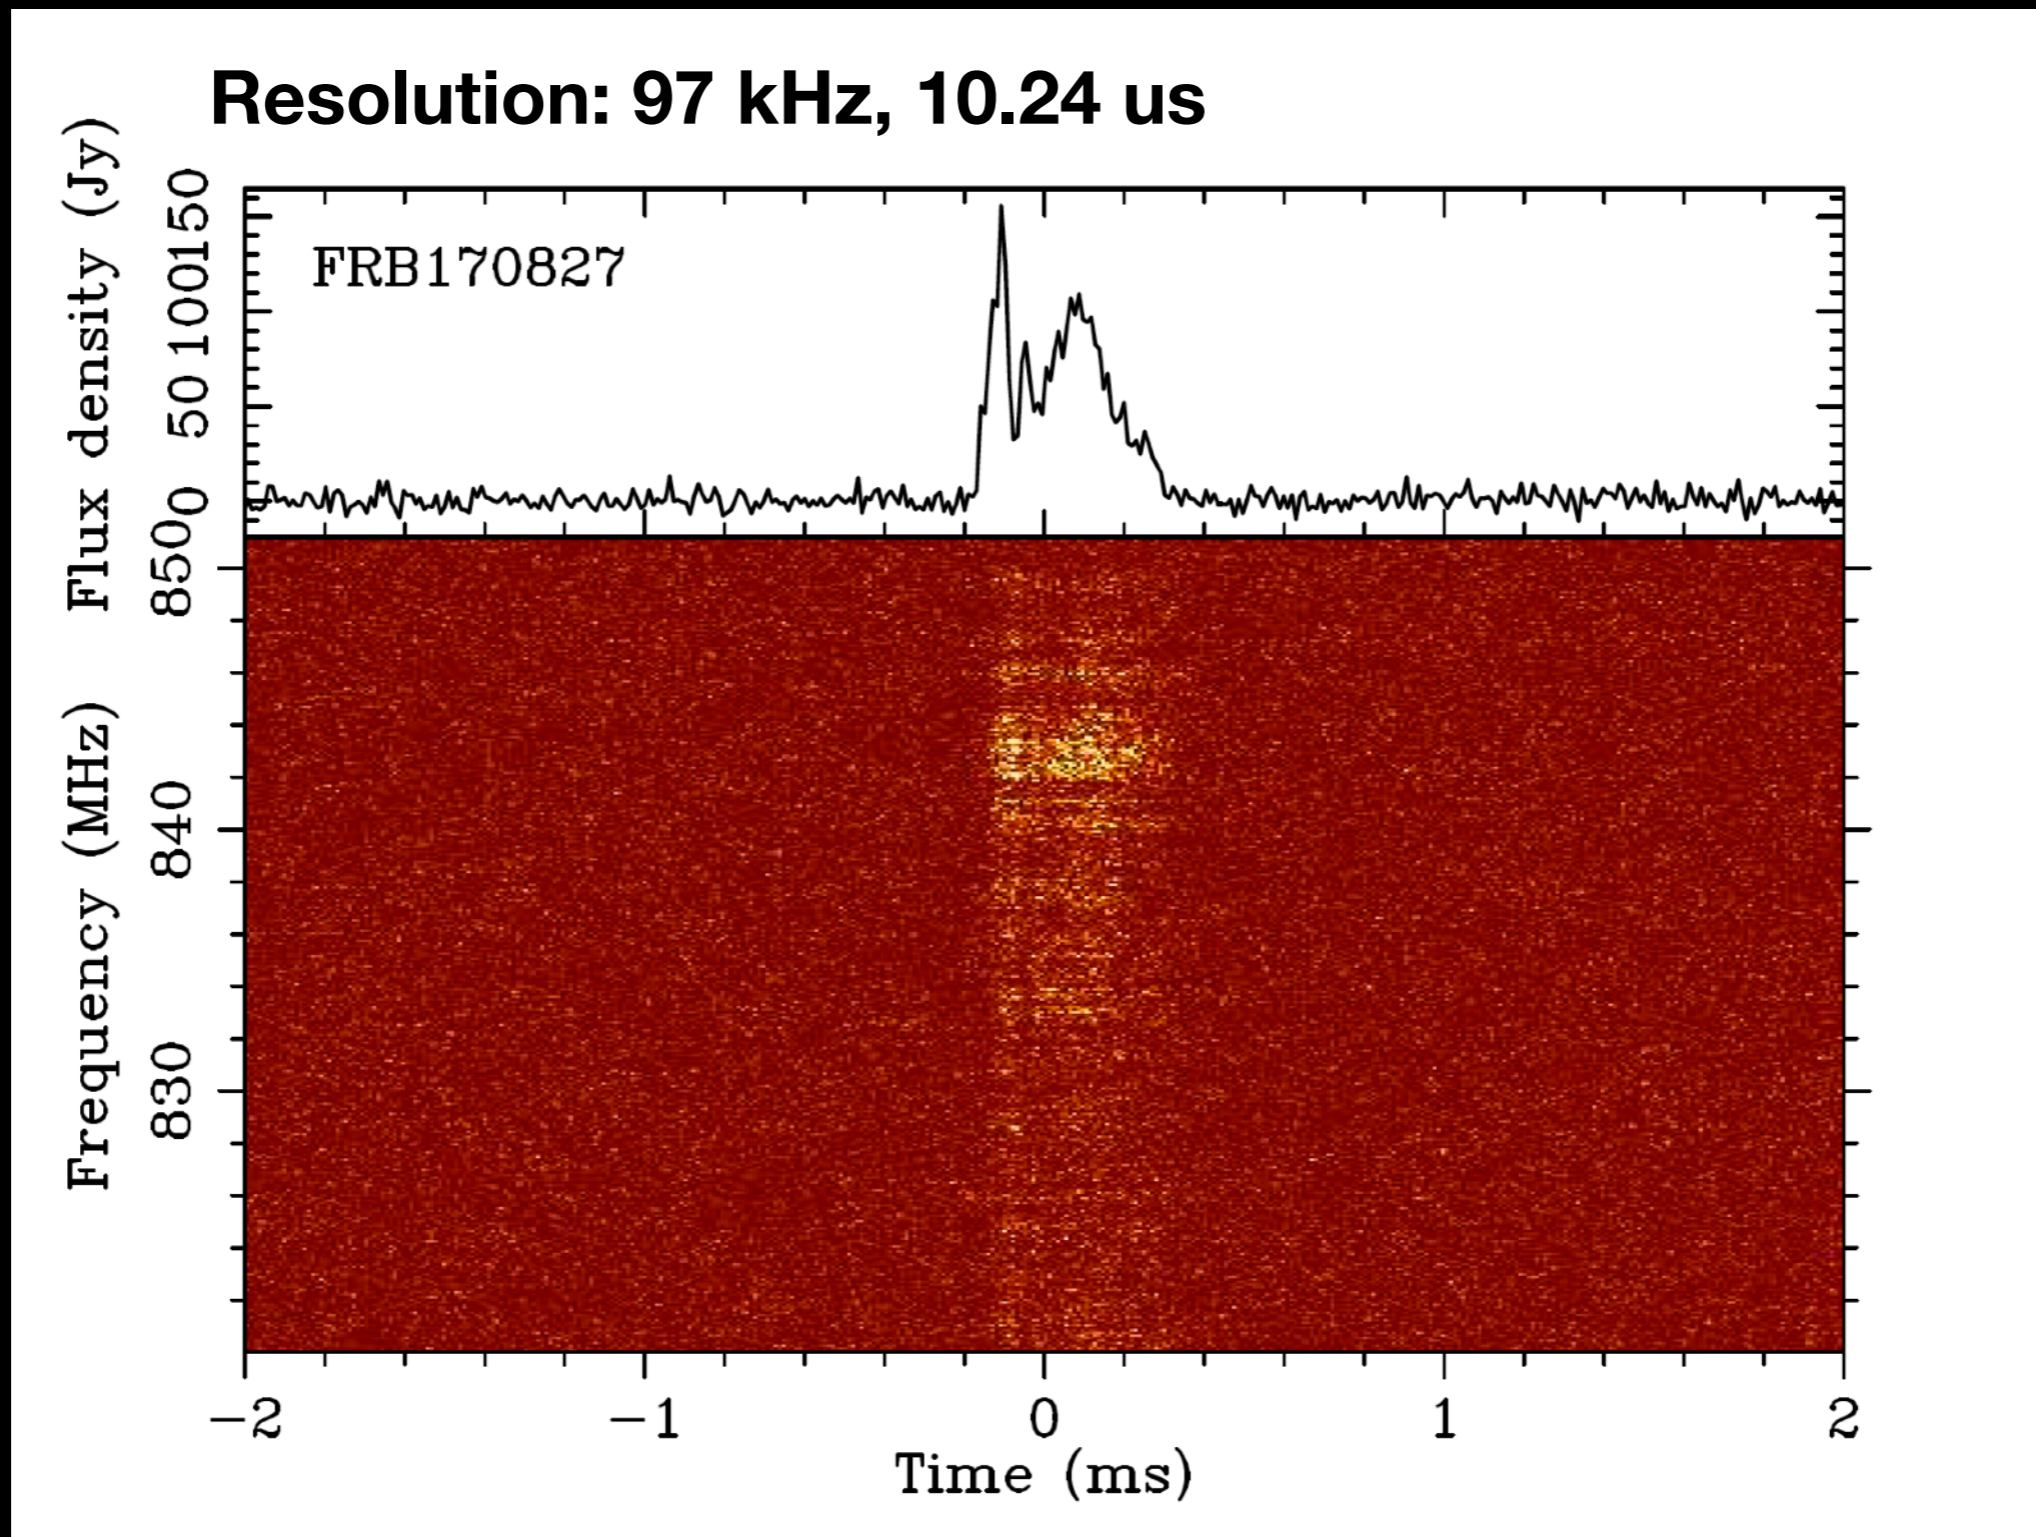

- Hyperfine fan beam layout
- Optimise event sky position

In-coherent dedispersion

Coherent dedispersion

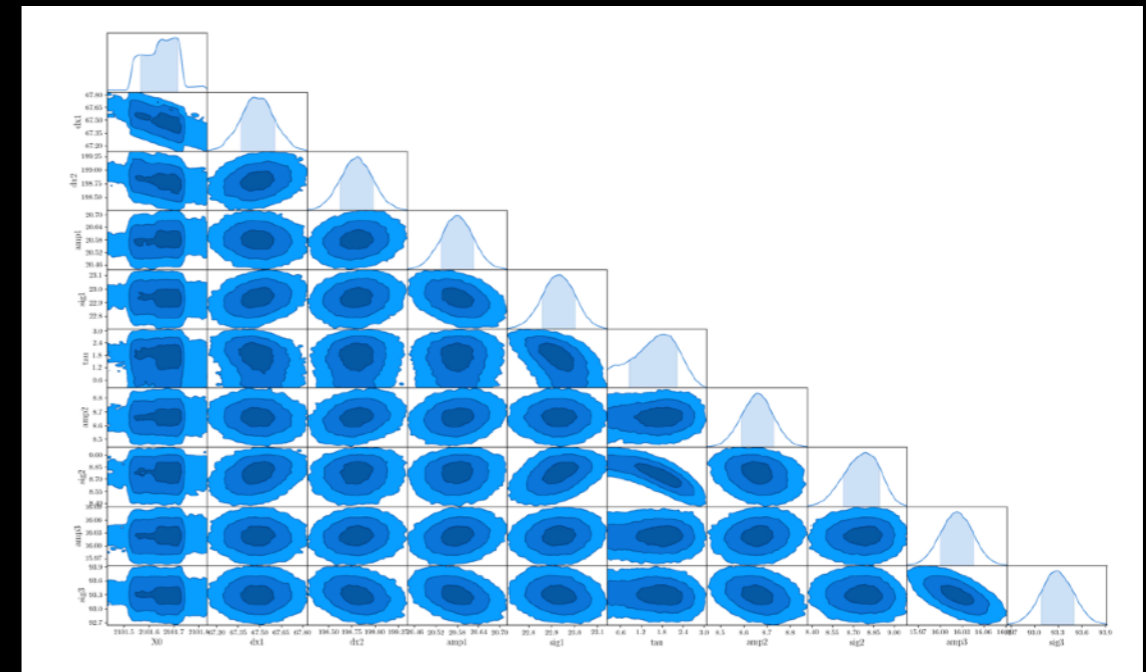

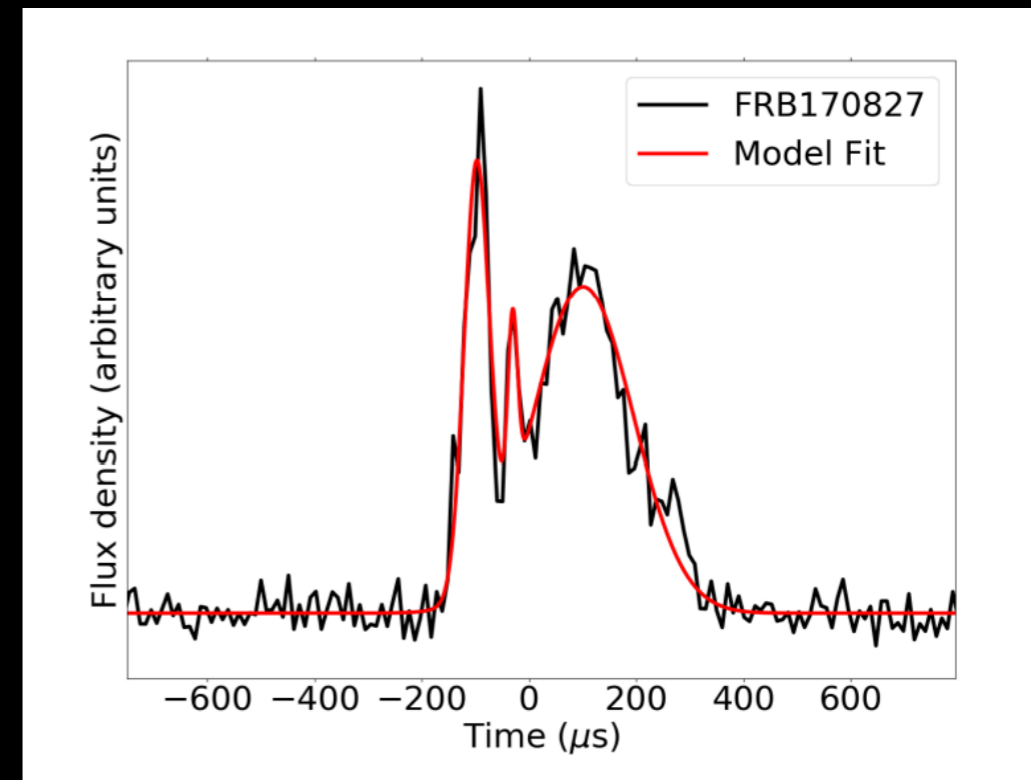

FRB Pulse Profile Fitting

- Three temporal features
- Least square fit - MCMC Model:

$$G_i(t | A_i, dt_i, \sigma_i, \tau) = A_i \times \left[\exp\left(-\frac{(t - dt_i)^2}{2\sigma_i^2}\right) \right] \\ * \left[\mathbb{H}(t - dt_i) \exp\left(-\frac{t - dt_i}{\tau}\right) \right]$$

$$G = G_1 + G_2 + G_3$$

- Widths = {23, 9, 93} micro-sec
- Tau = 2 us

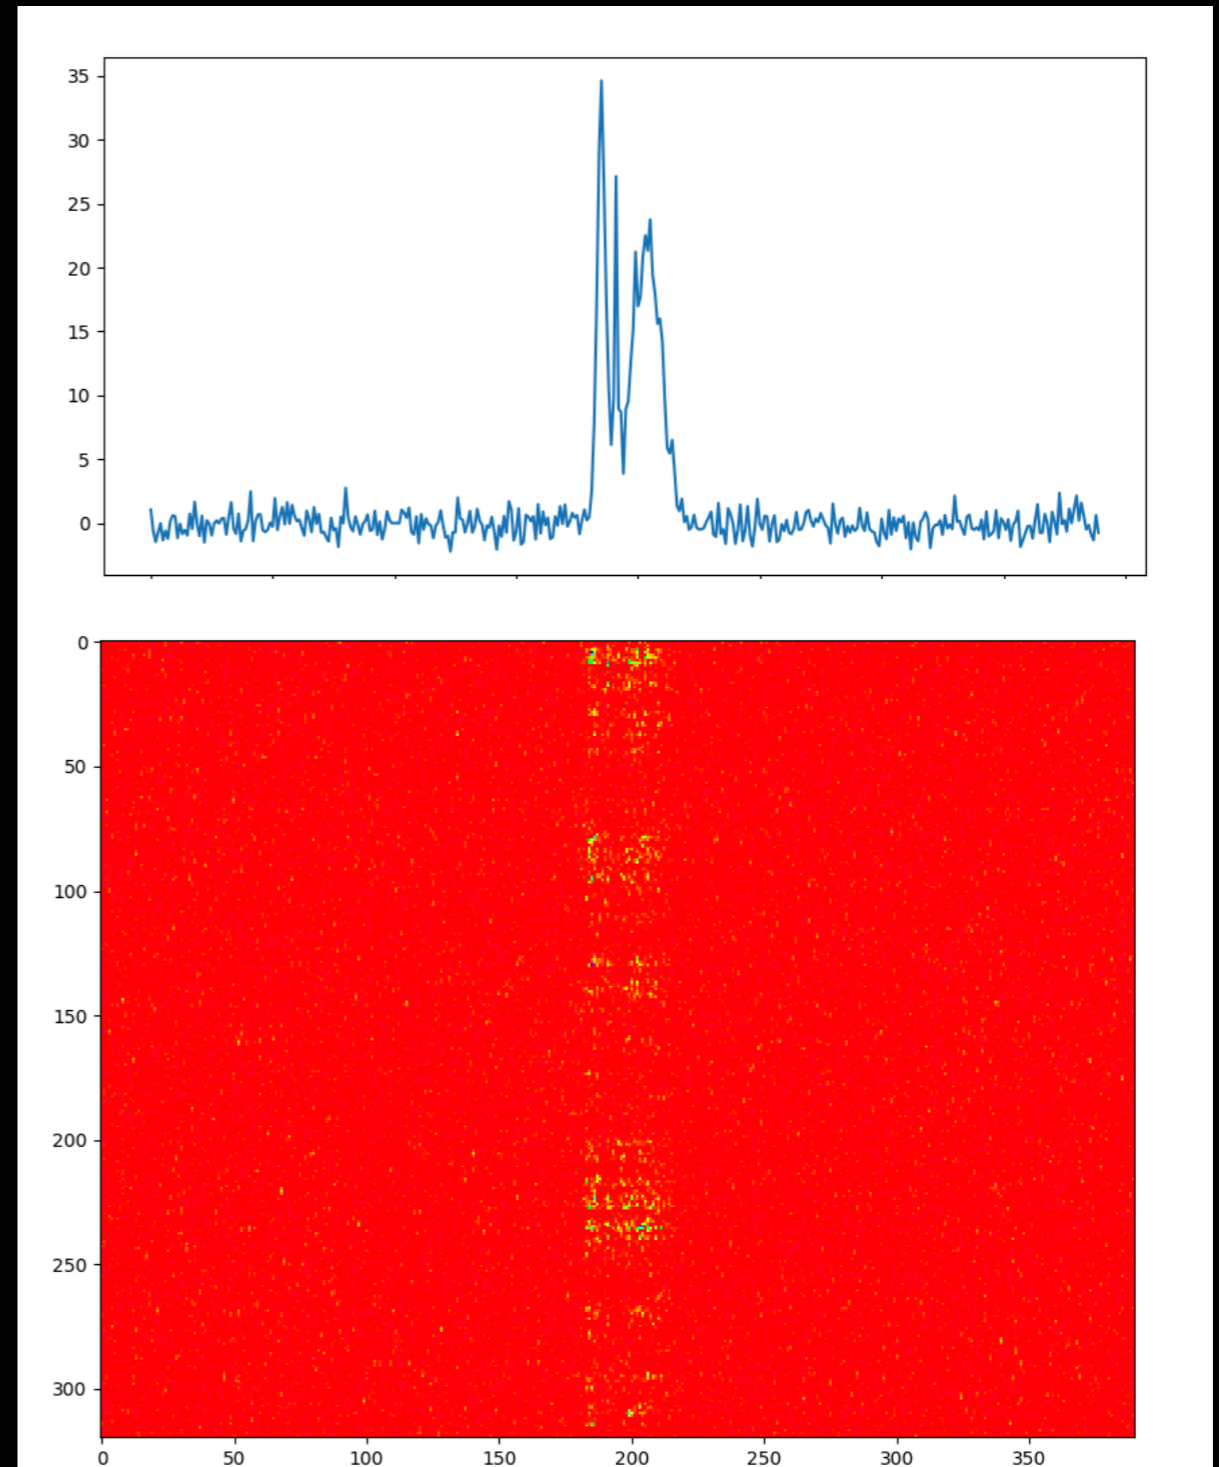

Spectral Modulation

- Spectral ACF / CCF were computed
- $\Delta\nu = 1.5$ MHz (expected along the line of sight, NE2001)
- Another spectral modulation scale?

Can't explain it? Simulate it!

- Amplitude modulated noise model
- Complex “voltages”
- 2 scattering screens:
 - 0.1 us broadening
 - 2 us broadening
- Can replicate FRB170827 spectral/temporal structure

And another snowflake - FRB 170922

22nd September 2017

- Real time detection, but no voltage trigger...
- $DM = 1111 \text{ pc cm}^{-3}$
- $DM_{MW} = 33 \text{ pc cm}^{-3}$
=> $z \approx 1$
- Width = 47 ms
- Fluence = 60 Jyms
- Scattering (not MW!)
($\tau \approx 30 \text{ ms @ } 843\text{MHz}$)

Multi-wavelength Followup

- SkyMapper
- ASKAP
- Parkes
- Molonglo

Conclusions

- FRB 170827 demonstrated Molonglo's ability to dump voltages for an FRB discovered in real time
- Native resolution of telescope => remarkable microstructure
- 2 screen model: possible explanation of the seen spectral modulation
- Similarities to the repeater,
except: it hasn't repeated yet...
